

ON THE TAIWAN SPECIES OF *DIOSCOREA*

TANG-SHUI LIU and TSENG-CHIENG HUANG⁽¹⁾

(Received February 8, 1961)

The family *Dioscoreaceae* has been treated before by some well-known botanists in the world. Dr. R. Kunth divided this family into two tribes, namely, *Dioscoreae* Pax and *Stenomerideae* Planch. and nine genera, namely, *Dioscorea* L., *Higinbothamia* Uline, *Borderea* Mieg., *Epipetrum* Phil., *Rajania* L., *Tamus* L., *Stenomeris* Planch., *Trichopus* Gaertn., and *Petermannia* F. Muell., in Engler's *Das Pflanzenreich*, 87 (IV, 43): 1-387, in 1924. He recognized 603 species of the genus *Dioscorea*, of which most species of Taiwan had been included. Drs. D. Prain and I. H. Burkill are also noted for their valuable contributions to the studies of *Dioscoreaceae*. Their most important work "A synopsis of the *Dioscorea* of the Old world, Africa excluded, with descriptions of new species and varieties" appeared in *Journal of the Asiatic Society of Bengal*, No. 5, X, 5-41 in 1914.

The first Japanese botanists who described *Dioscorea* of Taiwan is Dr. B. Hayata, whose research findings were published in *Icones Plantarum Formosanum* X, 36-49 in 1921. Professors Y. Yamamoto and G. Masamune and Drs. S. Sasaki and S. Kamikoti successively presented several papers on *Dioscorea* of Taiwan. It was Prof. Yamamoto who especially made detailed studies of these plants which had been reported in *Supplementa Iconum Plantarum Formosanarum* III, 5-9, 1927; in *Journal of the Society of Tropical Agriculture* X, No. 2, 180-182, 1938; and *Transactions of the Natural History Society of Formosa*. CCVIII, 38-44, 1938. There are altogether thirteen species and four varieties described and recorded by them.

This paper is a compendium of the knowledge of all the Taiwan species belonging to the genus *Dioscorea* with a key tentatively prepared by the authors and with detailed descriptions of the species. However, the descriptions of some specimens, like *Dioscorea japonica* var. *vera* and *Dioscorea persimilis*, that are not deposited in our herbaria, the Herbarium of Botany, Department of the National Taiwan University (TAI) and the Herbarium of Taiwan Forest Research Institute (TAIF), are not given in detail in this paper.

(1) Professor of Department of Forestry and Assistant of Department of Botany, National Taiwan University respectively.

Before going further the writers wish to acknowledge their indebtedness to Dr. H. W. Li, Director of the Institute of Botany, Academia Sinica, for his constant encouragement. Thanks are also due to Messrs. W. S. Gand and Y. Na for their assistance in supplying fresh plant materials for this study.

Dioscorea LINN. Sp. Pl. 1032 (1753)

Herbaceous twining vines with tuberous roots which are cylindrical or spherical in outline.

Stems terete or ridged, winged or wingless, pale green or violet in color, often bearing aerial tubers in the axils of leaves.

Leaves opposite or alternate, simple, entire or palmately lobed or divided, sometimes palmately compound, mostly arrow-shaped with cordate or auriculate bases, the venation reticulate with each of several primary veins extending to apex, long petiolate; the petioles usually sulcate above and dilated at base.

Inflorescence a raceme, panicle, or simple or fascicled spike. Flowers regular, small and inconspicuous, unisexual and dioecious; perianth segments 6, in 2 series; staminate flowers with 6 fertile stamens, or sometimes 3 fertile stamens and 3 staminodes; anthers 2-celled; the rudimentary ovary present or absent; pistillate flowers much similar to the staminate, with the staminodes 0, 3, or 6; pistil single, the ovary inferior, trilocular, with axile placentation; ovules 2 to numerous in each cell; the style one; stigmas 3, each of them bifurcate.

Fruit a 3-valved capsule, often 3-winged; seeds winged.

A rather large genus of more than 600 species of wide distribution over the earth in all hemispheres, but most abundant in the tropical America. There are 14 species and 5 varieties in Taiwan.

Key to Taiwan Species

1. Stem and petiole winged or quadrangular; leaves opposite..... 2
1. Stem and petiole neither winged nor angled 3
2. The skins of tubers, wings, petioles and leaves pale green in color..... (1) *D. alata*
2. The skins of tubers, wings, both ends of petioles and basal part of young leaves purplish in color..... (1A) *D. alata* var. *purpurea*
3. Leaves compound, alternate 4
3. Leaves simple 6
4. Plant glabrous; stem smooth; leaves 7-foliate, nerves pinnate..... (1) *D. cumingii*
4. Plant pilose; stem spiny; leaves 3-5-foliate, nerves palmate..... 5
5. Leaves 3-foliate, hispidate (3) *D. hispida*
5. Leaves 5-foliate, blackish-pilose..... (4) *D. codonopsisifolia*
6. Stem spiny; leaves alternate 7
6. Stem spineless 8
7. Plant pilose; nerves 9; fruit villose..... (5) *D. esculenta* var. *spinosa*
7. Plant glabrous and glaucous; nerves 3-7; fruit glabrous; leaves sometimes partly opposite..... (6) *D. formosana*

8. Leaves opposite, sometimes partly alternate 9
 8. Leaves alternate 16
 9. Leaves elliptic or oblong, apex acute, base obtuse or cuneate or truncate; nerves 3-5 10
 9. Leaves oblong-ovate or triangular-ovate, apex acuminate, base cordate or auriculate; nerves 7 11
 10. Leaves subcordaceous and glaucous, veinlets prominent on upper surface; pistillate inflorescences of 1-2 spikes, axillary; staminate inflorescences a panicle, rarely a portion of 2-3 fascicled spikes (7) *D. Matsudai*
 10. Leaves herbaceous and brownish, veinlets obscure on upper surface; pistillate inflorescences of 1-2 spikes, axillary; staminate inflorescences of 2-3 fascicled spikes, rarely a portion of single spike (8) *D. Benthamii*
 11. Staminate inflorescence of a panicle; leaves entire (9) *D. persimilis*
 11. Staminate inflorescences of fascicled spikes; leaves subentire, sometimes trilobed 12
 12. Leaves narrower, oblong-triangular or lanceolate-triangular (11A) *D. japonica* var. *Oldhami*
 12. Leaves broader, ovate-triangular 13
 13. Leaves auriculate at base (10) *D. batatas*
 13. Leaves broadly ovate at base 14
 14. Rachis slender (11B) *D. japonica* var. *vera*
 14. Rachis thicker 15
 15. Leaves membranaceous (11) *D. japonica*
 15. Leaves subcordaceous (11C) *D. japonica* var. *pseudojaponica*
 16. Leaves trilobed, narrower, 2-4 cm. long, 2-2.5 cm. wide, coriaceous (12) *D. doryophora*
 16. Leaves entire or subentire, broader, 6-15 cm. long, 4-10 cm. wide, herbaceous 17
 17. Fruit oblong; leaves mostly entire; cordate-ovate (13) *D. bulbifera*
 17. Fruit obcordate; leaves subentire, triangular 18
 18. Pistillate inflorescence of a panicle (14) *D. Kaoi*
 18. Pistillate inflorescences of single or fascicled spikes (15) *D. Collettii*

(1) *Dioscorea alata* LINN. Sp. Pl. ed. -1, 1033 (1753) & ed. -2, 1462 (1763); Wight, Icon. Pl. Ind. Ori. III, t. 813 (1840-56); Merr., Fl. Manila, 151 (1912); Hay., Icon. Pl. Formos. X, 42 (1921); Kunth in Pflanzenr. IV, 43, 265 (1924); Yamam., Suppl. Icon. III, 5 (1932).

Dioscorea pteroclada HAY. in Sched. Herb. Univ. Imp. Tokyo (nomen nudum). A twining vine with large tuberous roots; stems twisted, wrinkled, 4-winged or sharply 4-angled, 3-7 mm. thick; the wings undulate, 1-2 mm. broad, membranaceous rarely prickly on basal part of the stem after the wings fallen off; leaves chartaceous, glabrous, alternate below and opposite from the middle part above, triangular, oblong-triangular or oblong-ovate, 8-15 cm. long, 6-12 cm. wide, apex acuminate or short-caudate, the base auriculate or cordate, margins entire; nerves 7-9, prominent on both surfaces, veinlets fine and prominent; petioles winged, twisted and dilated at base, 3-5 mm. thick, 7-13 cm. long; the axillary tuber persistent, bulb-like, 4 cm. long, 1 cm. wide, rooting on stem; the staminate flowers in narrow axillary panicles 15-25 cm. long; the peduncle green, glabrous, winged; the pistillate flowers in simple spikes, composing of 8-14,

each flower bearing 1-2 basal bracts; capsule obovoid, 1.5-1.8 cm. long, 1.3-1.5 cm. wide, shortly stipitate.

DISTRIBUTION: Southern Asia: Philippines, India to Malaya. Mostly cultivated for the subterranean tubers.

SPECIMENS EXAMINED:

TAIPEI HSIEN: Kuan-ying Shan: Fukuyama & Miura, Sept. 23, 1940; Yangmingshan: Y. Yamamoto, June 1, 1938; Peitou: Shimada, Dec. 13, 1914 (TFRI).

CHINESE NAME: 大薯, 田薯

JAPANESE NAME: Daijo or Gunbai dokoro.

(1A) *Dioscorea alata* LINN. var. *purpurea* (ROXB.) M. POUCH. in Bull. Econ. Indo-China, N. Ser. 8. 117, (1950).

Dioscorea purpurea ROXB. Fl. Ind. III, 799, (1832).

The plant is similar in all respects to the typical species, but it can be easily distinguished by the skins of tubers, young leaves and petioles being all purplish in color.

DISTRIBUTION: India.

SPECIMENS EXAMINED:

TAIPEI HSIEN: Botanical Garden, T. C. Huang 1799, cultivated by Y. Na.

(2) *Dioscorea Cummingii* PRAIN et BURK. in Journ. Asiat. Soc. Bengal. New Ser. IV, 449 (1908) & X, 25 (1914).

Dioscorea Elmeri PRAIN et BURK. in Elmer, Leaflets Philip. Isl. V, (1913) 1954.

Dioscorea heterophylla SASAKI in Trans. Nat. Hist. Soc. Formos. XXI, 147 (1931).

A large glabrous perennial dioecious climber, attaining 15 m. high; stem terete, 4 cm. in diameter; leaves alternate, palmately compound; petioles 7-10 cm. long; leaflets 7, elliptic, narrowly obovate or obliquely long-ovate, entire, caudate-acuminate at apex, cuneate at base, 8-11 cm. long, 3.5-4.5 cm. wide, shining above, midrib elevated beneath, with lateral veins 5-6 on each side, shortly petiolate; Male inflorescence of a long panicle bearing dense flowers, 3-5 cm. long, axillary, pendulous, covered with canescent wools, shortly peduncled; bracts 2, orbicular, caudate, slightly incurved, the outer larger than the inner one, 1-2.5 mm. wide; perianth-segments 6, in 2 series, purplish, triangular,

obtuse at apex, 0.7–2 mm. long; female inflorescence similar to the male, with brown hairs on the top of the peduncle; bract 1, adnate to the calyx, 3 mm. long; ovary inferior, bottle shaped, 6 mm. long, 2 mm. across, covered with brownish pubescent hairs, 3-celled; ovules pendulous in each cell; fruit fleshy, long ovate, 2.5–2.7 cm. across, with persistent style; seed flattend, elliptic, 9 mm. long, 4.5 mm. wide.

DISTRIBUTION: Philippine.

JAPANESE NAME: Koban dokoro or Uchiwaba dokoro.

(4) *Dioscorea codonopsisifolia* KAMIK. in Trans. Nat. Hist. Soc. Formos. XXV, 115 (1935).

A twining herb covered with pale or blackish brown pilose hairs; stem terete, sulcate, about 2 mm. thick, spiny, bearing small rounded bulblet-like tubers in the leaf-axils; leaves alternate, digitately compound, long petiolate; leaflets 5, shortly petiolulate, the middle one oblanceolate, apex acute or shortly acuminate, base narrowly cuneate, margins entire, about 5-8 cm. long, 1-1.7 cm. wide, pinnerved, the lateral leaflets very short, obliquely elliptic, acute on both ends, about 4-5 cm. long, 1-1.6 cm. wide, 2-nerved; petiolules about 2 mm. long; midrib flat above, elevated beneath, veins and veinlets prominent on both surfaces, petioles about 3-5.5 cm. long.

Flowers dioecious, mostly in axillary single spike with the rachis about 4.5-5 cm. long, each spike bearing about 10-25 flowers.

Staminate flowers with perianth segments 6, the outer 3 thick, glabrous, ovate, apex narrowly obtuse, about 1.5 mm. long, 1 mm. wide, the inner 3 ovate-rhomboid, glabrous, equaling the outer ones in size; bract 2, the outer one cordate, apex acuminate, margins irregularly crenate, about 2.5 mm. long, 2 mm. wide, the inner one subtriangular, apex acuminate, glabrous, about 1.7 mm. long, 1.5 mm. wide, margins irregularly crenate. Fertile stamens 3, inserted on perianth tube and alternate with the 3 staminodes; filaments glabrous, 0.2 mm. long; anthers glabrous, about 0.5 mm. long; the staminodes bipartite at apex, about 0.5 mm. long, 0.2 mm. wide, rudimentary ovary present.

Female flowers and fruit have not seen.

DISTRIBUTION: Endemic.

SPECIMEN EXAMINED: At the foot of Mt. Tatun, about 100 m. high, Taipei Hsien (Kamikoti, Oct. 28, 1943. Type!).

CHINESE NAME: 掌葉薯。

JAPANESE NAME: Toratora Kazura.

(5) *Dioscorea esculenta* (LOUR.) BURK. var. *spinosa* (ROXB.) R. KUNTH in Engl. Pflanzenr. III, 189 (1924).

Dioscorea spinosa ROXB. ex Wall Cat. No. 5103 a. d. e. (1828); Wight in Journ. Linn. Sci. Bot. XXXVI, 91, (1903).

Dioscorea aculeata NAVES var. *spinosa* PRAIN et BURK. ex Burk. in Journ. Asiat. Soc. Bengal. X, 20 (1914).

A twining vine with large subterranean tubers; stem terete, brown, villose, 1–2 cm. thick, sparingly spiny or at least with 2 spines on the lower portion of petioles; spines curved, 0.6 cm. long, pale green or purplish on upper part; leaves alternate, yellowish green, chartaceous, entire or deeply incised; the blade rounded or broadly ovate, base cordate or auriculate, apex acute, 5–13 cm. long, 6–15 cm. wide, pubescent or glabrous above, whitish or yellowish-pilose beneath, 9–7 nerved; nerves extremely furcate; petioles green, sulcate above, dilated on both ends, forming an angle of 70°–90° with stem, 2.5–8 cm. long, base spiny or wanting in young leaves; staminate spike simple, about 15 cm. long, rachis large, pubescent; flowers subsessile, irregular, 2–10 mm. across, perianth campanulate-urceolate, pilose outside, 3 mm. long, shortly pedicellate, 6-lobed; lobes ovate, tube nearly as long as the lobes; fertile stamens 6, inserted on throat, slightly shorter than the perianth; anthers introrse; style small, subpyramidal; capsules broadly obcordate, about 22 cm. wide.

DISTRIBUTION: New Guinea, India, and Malaya.

SPECIMENS EXAMINED:

PINGTUNG HSIEN: Bankinsing: A. Henry, no. 856 in Herb. Hort. Bot. Kew.; San-ti-wen: S. Sasaki, Oct. 8, 1934; Huang 1793.

(6) *Dioscorea formosana* R. KUNTH in Engl., Pflanzenr. IV, 43, 268; (1924); Yamam., Suppl. Icon. III, 7 (1932).

Dioscorea rhipogonoides OLIV. var. *aculeata* ULINE ex Yamam. l.c.

A twining vine; stem terete, sulcate, 1–3.5 mm. thick, pale green, glabrous, sometimes spiny on basal part of stem; spines erect or recurred, 3 mm. long; leaves alternate, or the immature ones opposite, 5–15 cm. long, remotely arranged; blade papery, hastate-lanceolate or lanceolate, apex obliquely acute or acuminate, base deeply hastate, margins entire or incised or lobed, 8.5–12 cm. long, 2–4.5 cm. wide, glabrous, nerves 3–7, prominent on the lower side; the basal lobes triangular or ovate-quadrangular, apex obtuse or rotundate; petiole 7.5–15 cm. long, more or less firm, 1 mm. thick, sulcate above, slightly dilated at base.

DISTRIBUTION: Endemic.

(7) *Dioscorea Matsudai* Hay., Icon. Pl. Formos. X, 39, f. 20, (1921); Yamam. in Trans. Nat. Hist. Soc. Formos. XXVIII, 44, f. 4-5; (1938); Journ. Soc. Trop. Agr. Vol. XI, No. 4. 278-279, 1939.

Dioscorea rhipogonoides sensu Henry, List Pl. Formos. 96 (1896); Wight in Forbes et Hemsl. Journ. Linn. Soc. Bot. XXXVI, 91 (1903); Yamamoto, Suppl. Icon. Pl. Formos. III. 9 (1927); Sakaguchi, Gen. Ind. Fl. Okinawa 84 (1924); Mak. & Nemoto, Fl. Jap. 1232 (1925) and ed. 2, 1085 (1936); non OLIV.

A glabrous scandent perennial; stem terete, slender, yellow to brown, glabrous; leaves opposite, rarely alternate, elliptic-lanceolate, oblong-lanceolate or elliptic, 8-14 cm. long, 1.6-5 cm. wide, apex acute, base obtuse and truncate, chartaceous to subcoriaceous, glaucous beneath, nerves 3-7, prominent on both surfaces, petioles slender, 2-4 cm. long; staminate flowers many, rather densely crowded in an axillary panicle or fascicled spikes to single spike with the inflorescence 3-8 cm. long; each flowers with one basal bract, the bract ovate-triangular 0.6 mm. long, cuspidate; perianth segments 6, the outer 3 rotundate, 1 mm. in diameter, very concave, the inner 3 smaller; stamens 6, filament flat, 0.5 mm. long, anthers oblong, 0.2 mm. long; capsules 3-winged, 3.5-4 cm. long, 1.6-2 cm. wide, apex retuse, stipitate; the stalk 1-2 mm. long; seeds winged, 0.5 mm. long, 0.3 mm. wide, wing 1 mm. wide.

This plant is very near to *Dioscorea cirrhosa*, but it can be easily distinguished by the following characters:

- D. Matsudai: 1. Tuber rhizome-like or subglobose, simple.
2. Leaves narrower, glaucous beneath.
3. Anthers oblong.
4. Stem and petiole spineless.

- D. cirrhosa: 1. Tuber rounded or subglobose, fascicled.
2. Leaves wider, pale green beneath.
3. Anthers elliptic.
4. Stem and petiole spiny.

DISTRIBUTION: Liuchiu (Iriomote and Isigaki).

Dioscorea polystachya TURCZ. in Bull. Soc. Nat. Mosc. VII, 158 (1837).

Dioscorea opposita KUNTH, Enum. Pl. V. 390, p. pte. (1850). Kawakami, List Pl. Formos. 122 (1910).

Dioscorea japonica PEPIN in Mem. Soc. Imp. et Cent. d'Agr. repr. (1854).

Dioscorea Decaisneana CARR. in Rep. Hort. 111 (1865).

Dioscorea glabra F. V. MUELL. ex Sel., Pl. Extra-Trop. Countr. Ind. ed. 100(1880).

Dioscorea cayenensis LAM. var. *pseudo-batatas* HAUMAN in Anal. Mus. Nac. Buenos Aires XXVII, 488, t. 23, 24 (1915).

Tubers large, fleshy, mostly cylindrical, attaining 1 m. in length; stem twining, stout, ridged, glabrous, violet in color; leaves with long petiole, opposite or whorled; lamina triangular or ovate-triangular, apex acuminate, base hastate-cordate, rarely auriculate, 6-10 cm. long, 7-9 nerved; petioles and veins purple; aerial tubers axillary; flowers spicate, dioecious; male spikes 1-3, axillary; male flowers sessile, white, numerous, the perianth 6-lobed, stamens

6; female spikes pendulous; capsule obovate, 3-winged.

DISTRIBUTION: China, Japan, and Liuchiu. Commonly cultivated in Taiwan for its edible subterranean tubers.

SPECIMENS EXAMINED:

(14) *Dioscorea Kaoi* Liu et HUANG in *Taiwania* VII, 33 (1960).

An entirely glabrous slender scandent and twining subshrub up to 3 m. high with chartaceous or thinly coriaceous triangular-ovate leaves, paniculate fruiting inflorescence, and obcordate 3-winged capsules.

Stem and branches slender, rounded, about 2 mm. in diameter, smooth or very slightly sulcate and striate. Leaves alternate, petiolate; petioles slender, about 3.5 cm. long, glabrous, deeply canaliculate above, rounded and slightly striate beneath, dilated at base; the parts of dilation linear-triangular, somewhat falcate, about 5 mm. long, 1.7 mm. wide at base, clasping the stem; lamina chartaceous or thinly coriaceous when dry, triangular-ovate, obscurely 5-lobed, about 10.5 cm. long, 5.5 cm. wide, apex caudate-acuminate or long acuminate, base deeply cordate or auriculate-cordate, margins subentire, dull black above, brownish grey beneath when dry, glabrous on both surfaces, 9-nerved; nerves ascending, convergent at the apex, very slender, reticulate; nerves, veins and veinlets flattened or slightly elevated above, prominently elevated beneath. Flowers not seen. The fruiting panicles axillary, about 11-16 cm. long, glabrous; the peduncles slender, triangular in cross section, narrowly winged along the

angles; the branches of panicles simple, slender with 1-bract at the base; the bract triangular about 2 mm. long, 1 mm. wide, apex caudate. Capsules obcordate, 1.1-1.5 cm. long, 1-1.7 cm. wide with the wing slightly cordate at apex, obtuse-rounded at base; the stalk short, about 2-3 mm. long, with 1-3 bracteoles at base; bracteoles triangular, 1 mm. long. Seeds rounded, flattened, surrounded by a membranous wing, about 5 mm. in diameter with the wing.

This interesting plant is distinguished by its paniculate inflorescences, obcordate capsules, and triangular-ovate leaves which are undulate at base, with the 9-nerves being prominent on both sides. It may be very closely related to *Dioscorea Collettii* Hook. f., but the latter has the flowers arranged in a simple or fascicled raceme and the ovate-cordate leaves being with 7-nerves instead of 9.

DISTRIBUTION: Endemic.

SPECIMEN EXAMINED: Hwalien Hsien, Ta-lu-koh: Huang, no. 100 (Type), in forest near the Foungh-shan Office, at an altitude from 1,850 to 1,900 m.
